

Cerbo API:

Patient Supplement Endpoints:

Please note: All dates listed (creation times, sign dates, date of service, update-times) are listed in UTC, so you'll want to adjust **for your local timezone**. If you want to manage underlying supplement definitions please use the `/v1/supplements` endpoints.

1. Get All Supplements for a Patient

Endpoint: `/v1/patients/:patient_id/supplements`

Method: GET

Arguments:

- None

Sample Call:

```
curl -X GET https://un:pwd@subdomain.md-hq.com/api/v1/patients/2/supplements
```

Response Notes:

- The `prescribing_details` sub-object has an unreliable structure, so it's entirely possible that it will contain/omit specific properties. Make sure you have a handler for cases where this data is missing in your application.

2. Get a single patient supplement details

Endpoint: `/v1/patients/:patient_id/supplements/:supplement_prescribed_id`

Method: GET

Arguments:

- None

Sample Call:

```
curl -X GET https://un:pwd@subdomain.md-hq.com/api/v1/patients/1/supplements/325
```

3. Post a new patient supplement via the portal queue

Endpoint: `/v1/patients/:patient_id/supplements`

Method: POST

Arguments:

- enqueue: (true by default) If true, the system will insert the supplement into the active patient portal queue so that the clinic is notified and can review the proposed addition. This replicates the functionality of the patient portal queue.

Data:

- supplement_id: (required) An integer identifier for a supplement as returned from a `/v1/supplements/search/:term` query.
- notes: (optional) An string.

Sample Call:

```
curl --data '{"supplement_id": "242", "notes": "Takes in the AM with food and water"}' -X POST https://un:pwd@subdomain.md-hq.com/api/v1/patients/1/supplements?enqueue=true
```
